

Stargate Abilene / Lancium Clean Campus — Counterparty Diligence Memorandum

1.2 GW operational AI data center campus (Crusoe / Oracle / OpenAI), Taylor County, Texas — project structure, land position, capital stack, ownership, status, risk Prepared June 13, 2026 · Land Resource Partners · Internal and counterparty-restricted circulation · Not investment advice

I. Executive Summary

The opposite profile to a speculative permit play: this one is built, leased, capitalized, and running — and it still broke once. The Abilene campus (Lancium Clean Campus; “Stargate I”) is the most de-risked gigawatt-scale AI campus in the United States — live since September 2025, ~\$15B of committed capital, hybrid grid-plus-gas power, and multiple investment-grade hyperscalers competing for capacity. It is also the live case study in how single-counterparty AI data center risk transmits to lenders: in March 2026 the Oracle/OpenAI expansion lease collapsed, Nvidia paid Crusoe a \$150M deposit to backstop the dropped block and recruit a replacement, Microsoft stepped in on the adjacent capacity, and a winter storm had already knocked buildings offline for days. If this is the strong case for the sector, the tenantless tier (GW Ranch, Fermi) is far more exposed.

Structure: a project-finance real-estate deal wearing a “Stargate” label. The single most-confused fact in public coverage: **the \$500B Stargate JV does not own or finance Abilene.** The campus is owned by a Crusoe / Blue Owl Capital / Primary Digital Infrastructure JV, ground-leased from landowner Lancium, and net-leased to Oracle, which buys ~\$40B of Nvidia GPUs and resells cloud capacity to OpenAI. “Stargate I” is retroactive branding on a pre-existing Crusoe/Oracle deal. Crusoe CEO Chase Lochmiller, on record: “Our customer is Oracle. OpenAI is Oracle’s customer.”

Capital is real and senior-debt-heavy, ring-fenced against the Oracle lease. ~\$15B committed at the site: roughly **\$9.6B JPMorgan construction debt + ~\$5B Crusoe/Blue Owl equity**, plus Lancium’s \$600M campus debt. The debt is reportedly non-recourse, secured by the campus assets and the 15-year Oracle lease — classic project finance “like a merchant plant with a long-term offtake.” Blue Owl holds the controlling equity; Crusoe is the minority operator.

Verdict: a financed, operating, multi-tenant asset whose tail risk is demand volatility, not site control. The binding constraint here is the inverse of the spec plays: not “can they find a tenant,” but whether OpenAI’s offtake — against ~\$20B ARR and a reset ~\$600B (from ~\$1.4T) compute pledge — holds up enough to keep Oracle paying rent that backs JPMorgan’s loan. Oracle’s own credit is the transmission cable: ~14–16% GPU-rental margins, 5-year CDS that hit a record ~198 bps in March 2026, a Jan 2026 bondholder lawsuit, and an RPO backlog heavily concentrated in the OpenAI contract. The asset is sound; the counterparty chain above it is where the risk lives.

II. Project Structure

Attribute	Finding	Source
Project name(s)	Lancium Clean Campus / “Stargate I” / Crusoe Abilene; dev codenames “Project Artemis” (2021 origin), “Project Radiance” (Mar 2025 expansion), “Longhorn Data Center” (TCEQ air permit)	Crusoe; Develop Abilene; TCEQ
Location	5502 Spinks Rd, north/NW Abilene, Taylor County, TX (Spinks/Summerhill/ Old Anson/FM 2404 — not south/I-20)	datacentermap; KTXS

Attribute	Finding	Source
Scale	8 buildings, ~4M sq ft, 1.2 GW , up to 450,000 Nvidia GB200 (each building up to 50,000 GB200 NVL72 on one fabric)	Crusoe/GlobeNewswire (Mar 18, 2025); DCD
Power — hybrid	1.2 GW ERCOT grid interconnect (held by Lancium, AEP/ERCOT-approved) + ~360 MW behind-the-meter gas + battery storage (reported ~1 GW/4 GWh) + on/adjacent 265.5 MW Goodnight Wind Farm	Lancium; gridstatus; ESIG
On-site gas	TCEQ Standard Permit (“Longhorn,” approved Jan 22, 2025): ~360 MW across 10 simple-cycle turbines (5× Solar Titan 350 + 5× GE LM2500, SCR-equipped). Broader Crusoe fleet: 29 GE Vernova LM2500XPRESS (~1 GW), Parker Hannifin >1 GW, PROENERGY 13× PE6000	TCEQ Reg. 177263; lanin/Substack; DCD
Cooling	Direct-to-chip liquid cooling, closed-loop, zero-evaporation (air-cooled chillers; no cooling towers)	Crusoe; Lancium
Compute stack	Crusoe builds/owns shells + power; Oracle (OCI) installs/owns GPUs and operates cloud; OpenAI consumes. Build-to-suit / powered-shell-plus	DCD; constructionreviewonline
Entities	Land: Lancium Abilene LLC . Buildings: Crusoe / Blue Owl / Primary Digital Infrastructure JV . Lessee: Oracle. TCEQ entity “Longhorn Data Center”	Comptroller Ch.312 id 000017852; BusinessWire

Angle. The power configuration is the structural opposite of the off-grid Permian plays (GW Ranch, Fermi). Abilene is **grid-tied first, gas-bridged second**: it took an ERCOT interconnect (the thing GW Ranch was built to avoid) and added ~360 MW of on-site simple-cycle gas as fast-start bridge/firming while the grid and the six-building Phase 2 came up. That choice buys grid backup and avoided a multi-year wait only because Lancium had pioneered the ERCOT Controllable Load Resource model and already held the interconnect — but it also drops the grid-connected load squarely into the ERCOT large-load queue and SB6 regime (\$VI). The cooling design (closed-loop, air-cooled) is a genuine, deliberate water-risk mitigation given Abilene’s stressed reservoirs.

III. Land Position — Resolved (ground lease, not fee)

Unlike a speculative site where tenure is the central unknown, the Abilene chain is fully established and is a **ground lease, not a sale**:

Lancium Abilene LLC (fee owner + master developer) → Crusoe (ground-leases ~90 acres; builds & owns the buildings + brings power) → Oracle (15-year net lease of the facilities) → OpenAI (end user via Oracle cloud).

- **Owner:** Lancium Abilene LLC (subsidiary of Houston-based Lancium LLC) owns the campus and remains master developer as of 2026; Crusoe did **not** buy the land. Lancium’s role “begins and ends with finding the land and providing the power infrastructure.” (Develop Abilene, Nov 19, 2024; KTXS, 2026)
- **Acreage:** ~875 acres in the executed Chapter 312 legal description; ~1,045–1,100 acres total Lancium holdings (the variance is abated parcel vs. total footprint). Crusoe ground-leases ~90 acres within it. (Comptroller Ch.312 id 000017852; datacentermap)
- **Lancium background:** founded 2017 by **Michael McNamara (CEO) and Dr. Raymond Cline** (note: not “Grimstad,” a common misattribution). “Clean Campus” model = load sited at congested wind/solar nodes, ramped as an ERCOT Controllable Load Resource. Other sites: Fort Stockton (first campus, operating) and Childress (>1 GW interconnect approved). (BearBox v. Lancium, CAFC 23-1922, Jan 13, 2025; PRNewswire)
- **Lancium capital:** Hanwha Solutions led a ~\$150M round (~\$100M Hanwha) in Nov 2021; Blackstone reported to have invested ~\$500M in Nov 2024 toward ~5 GW of West Texas buildout (Bloomberg; one structural source could not independently confirm a current Blackstone stake — treat as reported);

~\$600M debt closed Oct 16, 2025 (Santander sole structuring bank, Cantor advisor). (Hanwha; Bloomberg; Lancium/PRNewswire)

- **Incentives:** City of Abilene Chapter 312 abatement, Reinvestment Zone RZ21-1, **85% for 10 years**, effective 2031–2044, min investment \$2.4B (Crusoe committed up to ~\$3.5B), **357 new jobs at ~\$57,600. Abilene ISD granted no abatement** (collects on 100% of value). No JETI (Ch. 403) school value-limitation agreement found — likely none. Projected ~\$22.6M/yr city + ~\$18M/yr county property tax across all 8 buildings. (Big Country Homepage; Develop Abilene; Comptroller)
- **Water:** City of Abilene allocated up to **500 gal/min**; closed-loop initial fill ~1M gal/building; actual draw reported ~20 gal/min (<5% of allocation) as of April 2026. No separate raw-water/groundwater contract identified. (Big Country Homepage; Inside Climate News, Apr 2026)

Could not be verified from primary records (CAD/deed access blocked): Taylor County CAD recorded parcel value, deed instrument numbers, prior landowner, and purchase price. A direct taylor-cad.org owner search (“Lancium Abilene LLC”) or title pull would settle these; they are not load-bearing given the abatement and press record already establish ownership and the lease chain.

IV. Ownership and Capital Stack

The “who owns / who pays / who bears risk” map

Layer	Owner	Instrument	Pays →	Bears
Land + substations	Lancium Abilene LLC (fee / master dev)	Ground lease to Crusoe; \$600M campus debt	Receives ground rent	Land / power / interconnect risk
Buildings + shells	Crusoe + Blue Owl RE + Primary Digital JV (Blue Owl controlling equity; Crusoe minority + operator)	\$3.4B → ~\$15B JV; “forward takeout” SPV	Ground rent → Lancium; debt service → JPMorgan	Real-estate risk (cushioned by Oracle net lease)
Building debt	JPMorgan (~\$9.6B incl. \$2.3B Phase-1 + \$7.1B Phase-2)	Senior, ring-fenced at SPV, secured by lease; reportedly non-recourse	Receives debt service	Senior credit vs. Oracle lease
Building lease	Oracle (lessee, ~15 yr)	Rent → JV	Rent → JV	Tenant credit + occupancy
GPUs / IT	Oracle (~400–450k GB200, ~\$40B)	Buys chips; leases compute to OpenAI	Pays Nvidia	GPU capex + obsolescence
Cloud compute	OpenAI (customer)	OCI contract (~\$300B / ~\$60B-yr from 2027)	Pays Oracle	Demand / offtake
Program equity	Stargate LLC (OpenAI ~40 / SoftBank ~40 / Oracle / MGX)	Separate \$500B program pledge	Funds other sites	Does not own Abilene

Site-level capital (the real, financed number)

- **~\$15B committed at Abilene I**, built up as: **Phase 1** — \$3.4B JV (Oct 15, 2024; Crusoe/Blue Owl/ Primary Digital), with a **\$2.3B JPMorgan construction loan** (Newmark-brokered, ~Jan 2025); **Phase 2** — additional **\$11.6B debt+equity** (May 2025), expanding the JV to ~\$15B for the full 8-building/1.2 GW campus, including a **\$7.1B JPMorgan tranche**. Sacra’s breakdown: ~\$9.6B JPMorgan debt + ~\$5B Crusoe/Blue Owl equity. Plus **Lancium’s \$600M** campus debt (Oct 2025). (BusinessWire; Bloomberg; DCD; Sacra, Apr 27, 2026)
- **Risk structure (important):** the debt is ring-fenced at the SPV, secured by the campus and the 15-year Oracle lease, and reportedly **non-recourse** to Crusoe/Blue Owl. JPMorgan underwrote against the Oracle lease, not Crusoe. If Oracle stops paying, the lenders take “a giant empty hyperscale shell.”

OpenAI’s partners (Oracle, Crusoe, Blue Owl, SoftBank) carry ~\$100B of associated debt; OpenAI itself bears none. (electroneconomics; Sherwood/FT)

Crusoe Energy (developer/operator)

- Founded **2018** by **Chase Lochmiller (CEO) and Cully Cavness (President)**; origin was “Digital Flare Mitigation” — flare-gas-powered Bitcoin mining — pivoted to AI cloud 2023–24. **Sold the legacy bitcoin/flare-gas business to NYDIG (Mar 25, 2025)** (~425 modular DCs, ~250–270 MW, ~55% of 2024 revenue) to become a pure-play AI infra developer. (CNBC; Sacra)
- Equity:** Series D Dec 2024, \$600M @ **~\$2.8B** (Founders Fund led; **Nvidia, Fidelity, Mubadala, Valor, Ribbit** participated); Series E Oct 2025, \$1.375B @ **>\$10B** (Mubadala Capital + Valor co-led). ~\$3.9B equity raised since founding. Additional debt: Brookfield \$750M, Upper90 \$225M, Victory Park \$175M. (Sacra, Apr 27, 2026) Note: the “~\$35B valuation” sometimes cited is CoreWeave’s IPO benchmark, not Crusoe’s — Crusoe is ~\$10B.

Blue Owl Capital (controlling equity)

- Lead/controlling equity via its Real Estate platform, with Primary Digital Infrastructure (CIO Bill Stein, ex-Digital Realty CEO); Crusoe is minority + operator. **Exact Abilene equity split is undisclosed** — do not assume the 80/20 split from Blue Owl’s separate ~\$27B Meta Hyperion JV. Risk-discipline signal: Blue Owl **walked away from funding Oracle’s ~\$10B Michigan (Saline Township) site** in Dec 2025 over unfavorable lease terms — it underwrites to lease quality, not Oracle’s name. (Global Data Center Hub; DCD)

The \$500B Stargate LLC (program equity — not the Abilene owner)

- Announced at the White House Jan 21–22, 2025: **\$500B over four years, \$100B immediate**; reported equity SoftBank ~40% / OpenAI ~40% / Oracle ~\$7B / MGX (Abu Dhabi) ~\$7B; SoftBank financial lead (Masa Son chairman), OpenAI operational lead. Scoped up Sept 2025 to ~7 GW / >\$400B over three years across new sites (Shackelford/Vantage, Milam, Doña Ana NM, Lordstown OH, Michigan). **This equity funds new greenfield sites, not Abilene’s title.** (OpenAI; TechCrunch; S&P Global)

Angle. This is a fundamentally bankable structure — senior bank debt sized against a 15-year investment-grade-adjacent lease, controlling institutional equity (Blue Owl), and an operator (Crusoe) with skin in the game but no balance-sheet dependence on it. That is exactly why it got built while the off-grid spec plays did not. The fragility is not in the layer cake’s construction; it is that **every layer’s cash flow ultimately rests on OpenAI’s ability to pay Oracle**, and OpenAI is pre-profit with commitments far ahead of revenue. The non-recourse ring-fence protects Crusoe/Blue Owl’s other assets, not the building’s value if the offtake fails.

V. Status and Milestones

Item	Status (June 2026)
Groundbreaking	June 2024 (Lancium broke ground on the broader campus Nov 2022)
Phase 1 live	Verified. Two buildings (~980k sq ft, 200+ MW critical IT) energized and live on OCI for OpenAI Sept 30, 2025 ; first Nvidia GB200 racks delivered June 2025
Compute delivered	GPT-5.5 reportedly trained on-site — a concrete capacity-delivered datapoint (OpenAI). “Hundreds of thousands of GPUs operational” is aggregate marketing, not an independently verified live count
Buildout	8th (final) building topped off Nov 2025 ; ~4 of 8 buildings operational mid-2026 (“most complete Stargate site”); full 1.2 GW guidance slipped from mid-2026 → end-2026/Q1 2027
On-site gas	TCEQ “Longhorn” permit approved Jan 22, 2025 (~360 MW); permit modified to raise run hours 5,880 → 8,760 (continuous) — i.e., baseload, not pure backup

Item	Status (June 2026)
Reliability event	Winter weather in early 2026 damaged liquid-cooling equipment, taking several buildings offline for days — a contributing factor in the expansion pullback
Expansion reversal	Mar 2026: Oracle/OpenAI dropped the planned ~600-700 MW Abilene expansion (financing terms + OpenAI's shifting demand + reliability + a decision not to mix Blackwell with next-gen Vera Rubin). Existing 1.2 GW unaffected. Oracle disputes the "cancellation" framing
Backfill	Nvidia paid Crusoe a ~\$150M deposit to hold the dropped block and recruited Meta (to keep the site Nvidia, not AMD); Microsoft announced a separate adjacent 900 MW campus (Mar 27, 2026; 20-yr lease; first building ~mid-2027) → ~2.1 GW total Abilene footprint, now multi-tenant
Financing posture	Lancium CEO McNamara (Apr 2026): campus "fully financed long-term," Oracle 15-yr + Microsoft 20-yr tenants
Labor	~5,000-9,000 peak workers; 24/7 build; Abilene housing strain (rents +~\$1,000/yr); one resident hospitalized after being struck by a construction truck. No confirmed on-site worker fatality (two nearby data-center deaths — Haskell, Medina counties — are different projects)

Next 12-24 month milestones to watch: full 1.2 GW / 8-building energization (Q1 2027 guidance); Microsoft 900 MW campus first power (mid-2027); resolution of the Meta-vs-Microsoft backfill; Oracle credit trajectory (CDS, ratings, the bondholder suit); OpenAI's next funding round and whether its ~\$600B compute reset holds; SoftBank liquidity.

VI. Risk Register

Risk	Rating	Substance
Counterparty / offtake concentration	HIGH	The whole stack rests on OpenAI → Oracle → JV → JPMorgan. JPMorgan debt is reportedly non-recourse, secured by the Oracle lease; "if Oracle stops paying, the lender takes an empty shell." This risk partly fired in Mar 2026 when the expansion lease collapsed and needed an Nvidia deposit + Microsoft/Meta backfill. Banks had already hit single-counterparty (Oracle) exposure limits; JPMorgan struggled for months to syndicate
OpenAI affordability	HIGH	~\$1.4T in compute commitments over 8 years (Altman, late 2025), reset toward ~\$600B by 2030 (Feb 2026), against ~\$13-20B revenue / ~\$20B ARR and ~\$9B+ net loss; HSBC: not cash-flow positive by 2030, needs ~\$207B more capital. Oracle deal alone ~\$60B/yr from 2027
Oracle credit (the transmission cable)	HIGH/ MED	~14-16% GPU-rental gross margin (a ~\$100M operating loss renting Blackwell, per internal docs); 5-yr CDS hit a record ~198 bps Mar 2026 (>2008 peak), then eased after a \$50B raise plan; Moody's Baa2 / S&P BBB, both negative outlook (outlook, not a downgrade); \$18B (Sept 2025) + \$25B (Feb 2026) bonds; bondholder lawsuit Jan 15, 2026 alleging non-disclosure of a \$38B DC debt facility; RPO ~\$638B (Q4 FY26) heavily concentrated in the OpenAI contract
Circular / vendor financing	MED	Nvidia is simultaneously a Crusoe equity investor, Oracle's GPU vendor, and put a \$150M deposit into Crusoe; AMD guaranteed a \$300M Crusoe chip-loan lease-back; Nvidia's "\$100B" OpenAI commitment was walked back to ~\$30B and called "never a commitment" (Feb 2026). Bernstein/Bloomberg/The Register flag round-tripping. Burry alleged hyperscaler depreciation understatement (note: his "\$1.1B short" is misreported; actual premium ~\$9.2M)
ERCOT / SB6	MED	Grid-connected ~1.2 GW load sits in an ERCOT large-load queue that ballooned ~300% in 2025 to ~226 GW. SB6 (June 2025) imposes remote-disconnect + mandatory curtailment on >75 MW loads interconnected after Dec 31, 2025 — Phase 1 may be partly grandfathered, but expansion capacity falls under the curtailment regime . NERC flagged large-load voltage ride-through risk
Reliability	MED	The winter-2026 cooling outage demonstrated the failure mode; firm on-site gas + battery mitigate but the liquid-cooling system itself proved weather-vulnerable

Risk	Rating	Substance
Power economics	LOW/ MED	Favorable: Waha gas went negative for a record streak in Feb 2026; on-site simple-cycle beats waiting in the queue. But ERCOT West is congestion/curtailment-heavy, and SB6 curtailment caps the grid leg's firmness
Air / environmental	MED	"Longhorn" gas permit run-hours raised to continuous (8,760) undercuts the "backup only" narrative (~1.6M tons GHG, 14 tons HAPs/yr); "Save Abilene" opposition; Texas Observer health coverage. Milder than peers (Meta Hyperion, xAI Colossus face lawsuits)
Water	LOW	Air-cooled closed-loop = genuinely low draw (~20 gpm vs. 500 gpm allocation). Context is stressed (Abilene reservoirs declining, city bought 2.5B gal from Possum Kingdom Feb 2025) but not a binding constraint for this design
Crusoe execution	MED	~7-year-old company valued as a hyperscaler but operating as a leveraged "build-and-flip" developer (~\$30B capex to 2030, ~\$18B from selling stakes in its own projects). Pushed off its own 1.8 GW Wyoming "Project Jade" by Google over cost/timetable concerns — the sharpest execution datapoint
SoftBank liquidity	MED	Funded its \$22.5B tranche but is strained: sold its entire Nvidia stake (\$5.83B, Nov 2025), \$40B bridge due Mar 2027, S&P negative, ~98% return concentration in OpenAI. "If OpenAI fails to deliver, there could easily be a liquidity crunch at SoftBank"
Stargate JV dysfunction	LOW (for Abilene)	The \$500B JV reportedly stalled ~15 months with no staff and no JV-built sites; OpenAI now calls "Stargate" an umbrella term and prefers to lease. Low direct impact on Abilene (separately financed) but a negative signal on the program narrative

VII. Differentiators and Vulnerabilities

What makes Abilene the strong case in the cohort

- **It is actually built and running** — Phase 1 live since Sept 2025, GPT-5.5 trained on-site, ~half of 8 buildings operational. No peer GW-scale campus is further along.
- **Capitalized with senior bank debt against a long lease** — the bankable structure (JPMorgan + Blue Owl + 15-yr Oracle lease) that tenantless plays cannot replicate.
- **Multiple investment-grade-adjacent tenants competing for capacity** — Oracle, Microsoft, and Nvidia-via-Meta all wanted the site; tenant churn, not tenant absence, is the issue.
- **Hybrid power with a pioneer interconnect** — Lancium's ERCOT CLR model delivered a 1.2 GW grid tie plus ~360 MW fast-start gas, avoiding both the pure-queue wait and the pure-off-grid reliability bet.
- **Air-cooled, near-zero-water design** — a real de-risking in drought-stressed West Texas.

Where Abilene is vulnerable

- **Demand-side, not supply-side.** The risk is OpenAI's offtake durability transmitting through Oracle's thin margins and stretched credit to non-recourse lenders — a chain that already snapped once on the expansion.
- **Counterparty churn cost.** When the anchor lease dropped, it took an Nvidia deposit and months of re-leasing to backfill — capacity got re-tenanted, but not seamlessly.
- **SB6 curtailment on grid-connected expansion capacity**, and a demonstrated cooling-reliability failure mode.
- **Operator concentration risk in Crusoe**, a young, highly leveraged build-and-flip developer that has already been removed from one of its own flagship campuses.

Competitive set (June 2026)

Campus	Scale	Status / signal	De-risking
Stargate Abilene (Crusoe)	1.2 GW live	Expansion lease collapsed Mar 2026; Microsoft/Nvidia-Meta backfill; winter cooling outage	Best: live, ~\$15B capitalized, multi-tenant, grid+gas
Fermi America (Amarillo)	11 GW planned	Stock -81% ; tenant pulled \$150M (Dec 2025); CEO+CFO out; securities class actions	Weak: speculative, no firm anchor
Pacifico GW Ranch (Pecos)	7.65 GW permitted, off-grid	No named tenant, no financing, no land title disclosed	Weakest: tenantless option
Poolside / CoreWeave Horizon (Pecos)	2 GW	Collapsed Mar-Apr 2026 (CoreWeave terminated anchor after Poolside's raise failed); courting Google	Failed
Microsoft Reeves County	~2,500 MW	Microsoft canceled ~200 MW of US leases (demand-caution signal)	Mixed
Meta Hyperion (Louisiana)	5 GW	Strong tenant; 10 gas plants; heavy ratepayer/enviro backlash (UCS: up to \$90B damages)	Strong tenant, enviro/ratepayer risk
xAI Colossus (Memphis)	—	Strong tenant; NAACP/SELC/Earthjustice suit over 27 unpermitted turbines; EJ/legal risk	Strong tenant, severe enviro/legal risk

VIII. Falsification Conditions

- **On “most de-risked / bankable”:** an Oracle credit downgrade (not just outlook) plus a failed syndication or a covenant breach on the JPMorgan facility; or OpenAI defaulting/restructuring its Oracle cloud contract; or Blue Owl writing down its Abilene equity. Any one would move this from “de-risked operating asset” toward the distressed tier.
- **On “demand is the binding constraint, not the asset”:** sustained OpenAI ARR growth covering the ~\$60B/yr Oracle obligation, plus Microsoft's 900 MW reaching FID/first power on schedule, would refute the demand-fragility thesis and confirm the asset is durably tenanted.
- **On “Abilene ≠ Stargate JV”:** any disclosure that Stargate LLC equity actually capitalized the Abilene real estate (rather than Crusoe/Blue Owl/JPMorgan) would change the ownership analysis — none found to date.
- **On the bear base case:** triggers confirming it are an Oracle ratings downgrade, an OpenAI funding miss or down round, a SoftBank liquidity event, or a second reliability outage at scale. De-risking triggers: a clean Microsoft FID, OpenAI Q4 2026 IPO at/above the ~\$850B mark, and Oracle CDS normalizing.

IX. Action Items and Decision Thresholds

#	Action	Window	Decision threshold
1	Pull Taylor County CAD (“Lancium Abilene LLC”) + deed records to confirm fee owner, recorded value, prior owner	0–30 days	Confirms the only unverified land item; not load-bearing (lease chain already established)
2	Pull the JPMorgan facility terms / any rated tranches and the Oracle lease structure (recourse, covenants, term, rent)	0–60 days	Recourse + covenant package defines lender (and any successor-owner) exposure if OpenAI/Oracle falter
3	Track Oracle credit weekly: CDS, Moody's/S&P actions, the Jan 2026 bondholder suit, RPO concentration disclosures	Ongoing	A downgrade (not outlook) or suit progress is the leading indicator of stress transmitting to the asset

#	Action	Window	Decision threshold
4	Monitor OpenAI funding/IPO and the \$600B compute reset vs. actual ARR; SoftBank liquidity	Ongoing	Funding miss / down round / SoftBank event = demand-side bear case confirming
5	Confirm Microsoft 900 MW campus reaches FID + first power (~mid-2027) and resolve Meta-vs-Microsoft backfill	30-180 days	Clean multi-tenant FID = durable demand; further slippage = churn risk persisting
6	Watch SB6 rule (PUCT, due Dec 31, 2026) for curtailment treatment of the grid-connected expansion capacity	90-365 days	Heavy curtailment obligation reprices the grid leg's firmness
7	If engaging directly: as comps for any LRP West Texas land/power position, treat Abilene as the "tenanted + grid + gas" benchmark; the value premium is the lease, not the dirt	Standing	—

X. Caveats and Undisclosed-Items Register

- **Undisclosed:** exact Crusoe/Blue Owl/Primary Digital equity split at Abilene; precise Oracle lease NPV and recourse terms; Lancium's current Blackstone ownership %; Taylor CAD recorded value/prior owner/deed numbers; final Meta-vs-Microsoft tenancy of the backfilled capacity.
- **Corrections to common misreporting:** the **\$500B Stargate JV does not own/finance Abilene** (Crusoe/Blue Owl/Lancium do; Oracle leases it); the "**~\$30B**" figure is the annual OpenAI→Oracle cloud run-rate (the deal is ~\$300B / ~\$60B-yr from 2027), **not** the building lease; **Crusoe is ~\$10B** (the "~\$35B" is CoreWeave's IPO benchmark); **Oracle issued two bonds** (\$18B Sept 2025 + \$25B Feb 2026); **Lancium's backer is Hanwha** (not DataBank); **Lancium co-founders are McNamara + Cline** (not Grimstad); **Vantage's Frontier (Shackelford County) is a separate Stargate site** and owns no part of Abilene I; **Burry's "\$1.1B short"** reflects ~\$9.2M of actual premium; **Oracle has a "negative outlook," not a downgrade**; the **Haskell/Medina worker fatalities are different projects**, not Abilene.
- **Numbers that moved:** Nvidia's "\$100B" OpenAI commitment → ~\$30B, called non-binding (Feb 2026); OpenAI's "\$1.4T" compute framing → ~\$600B (Feb 2026); the Abilene expansion went from "doubling to ~2 GW for OpenAI" to "cancelled, backfilled by a separate 900 MW Microsoft campus."
- **Site naming:** Abilene is north/NW (Spinks Rd), not south/I-20.
- **Method:** primary-domain fetches (Bloomberg, FT, The Information, CNBC, Oracle, OpenAI, Crusoe, Lancium, county CAD) were network-blocked during research; findings rest on search-indexed extracts of those primary pages plus corroborating outlets and the directly-read Sacra Crusoe equity report (Apr 27, 2026). Highest-stakes Bloomberg/FT/The Information figures should be confirmed against live URLs before external citation. Nothing herein is investment advice or an offer to transact.
