

1,300 ACRES

contiguous, on Interstate 10, with 47,418 acre-feet a year of permitted water, long-haul fiber at the boundary, and no zoning to clear.

A single block of land with the things a large power or data-center project normally spends years assembling — already in place, and permitted rather than applied for.

|                                  |                                          |
|----------------------------------|------------------------------------------|
| Size and configuration           | Up to 1,300 contiguous acres             |
| Frontage                         | Direct Interstate 10 frontage            |
| Long-haul fiber                  | Along the I-10 corridor                  |
| Rail                             | Union Pacific Sunset Route               |
| Town, services, regional airport | ~5 miles                                 |
| Zoning                           | None — industrial and energy as of right |

WATER — THE PART THAT IS HARDEST TO REPLICATE

47,418 ACRE-FEET PER YEAR  
≈ 42 MILLION GALLONS A DAY

Permitted on adjacent affiliated land — roughly two-thirds of every industrial water right the local groundwater district has issued, at a volume that supports large-scale cooling.

The Edwards–Trinity aquifer here is refilled each year by runoff from the mountains to the south, rather than drawn from a reservoir that only depletes. Its recharge record held through the 1950s drought of record.

# Grid access, fuel for on-site generation, and 9.65 GW of hyperscale capacity going in within 19.3 miles.

*The developers already building here reached the same conclusion about this corridor, with their own capital.*

## A PLACE ON THE GRID

15 MILES TO THE 765 kV  
IMPORT TERMINUS

Fifteen miles from where all three approved 765 kV import lines land — the largest transmission program in the grid operator’s history, approved and being built. Three substations sit within seven miles.

## FUEL FOR ON-SITE POWER

20 MILES TO THE  
WAHA GAS HUB

West Texas gas trades below the national benchmark — at times below zero. That is why the campuses nearby are building their own generation rather than waiting for grid power.

|                            |                            |
|----------------------------|----------------------------|
| Indicative supply quote    | 200,000 MMBtu/day          |
| Term                       | 15 years, at the hub price |
| Utility build contribution | \$15-25 million            |

## WHAT IS ALREADY BEING BUILT

9.65 GW ANNOUNCED WITHIN  
19.3 MILES

7.65 GW of it already under construction. Both campuses sit on the same north-south line through the property.

★ 1 Amazon — 7.65 GW  
15.5 mi · under construction · 35 gas turbines

2 Second announced campus  
19.3 mi · site work underway · 2 GW planned gas

Counterparty site names withheld pre-NDA.

## AVAILABLE UNDER NDA

Counterparty names, water and transmission documentation, indicative gas terms, and logged access to the diligence platform behind this summary — where every figure here can be checked against its public source.

### WHY IT IS HAPPENING HERE, NOW

Requests to connect large new loads to the Texas grid grew from 63 GW at the end of 2024 to roughly 474 GW by August 2026, about 90% of it data centres — enough that the state paused new reviews pending an audit. The capacity already permitted and building around this property is outside that queue.
