

# THE GRID WIRE

Vol 17 | Friday, June 12, 2026 | 9:30 AM ET cut, expanded full edition by operator request, covering June 10 close through the June 12 open | All-sector coverage: AI infrastructure, oil and gas, midstream and LNG, solar, storage, geothermal, nuclear and uranium, utilities, compression, transmission, electrification

## I. The Tape

| Series                   | Level                             | Context                                                                                                                                                                                                                                                 |
|--------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Iran ceasefire           | 60-day deal announced June 11     | Hormuz reopens with no tolls; Iran clears its mines within 30 days; US lifts the port blockade and issues oil sanctions waivers. Signing possible this weekend in Europe. Nuclear stockpile is the first agenda item of the 60-day window. <sup>5</sup> |
| WTI (crude)              | \$87.71 close; \$86.51 extended   | Fell 3.9% after Trump called off Thursday-night strikes and said a deal is close. Off ~\$8 from the Vol 16 print in two sessions. Further weakness premarket June 12. <sup>4,13</sup>                                                                   |
| Equities (June 11 close) | Dow +929.97 (+1.86%) to 50,848.75 | Nasdaq +2.5%, S&P 500 +1.7% on the de-escalation. Tech, industrials, materials led; energy, staples, real estate declined. ORCL -9.4% against the +930 tape (see §III). S&P futures +0.6% premarket June 12. <sup>1,8,13</sup>                          |
| UST 30Y                  | ~4.95-5.01%, rallying             | Long end eased on the ceasefire tape (TYX -1.47% June 11). Still a 4.95%+ long bond against a hiking-biased front end. <sup>2</sup>                                                                                                                     |
| Fed (June 17 FOMC)       | ~96.5% hold at 3.50-3.75%         | Hike at this meeting effectively zero. No 2026 cuts priced; probability of a hike within a year still rising as of June 11. The hawkish-hold base case from Vol 16 stands. <sup>3</sup>                                                                 |
| SpaceX IPO               | Priced \$135; trades today        | \$75B raise at ~\$1.77T, 555.6M shares, ticker SPCX, largest IPO in history. ~30% reserved for retail (~\$22B). Offshore perpetuals marked ~\$176, +30% vs the print, before the open. <sup>11</sup>                                                    |
| Henry Hub (gas)          | +108 Bcf injection (vs 99 est)    | Week ending June 5. Surplus to the five-year average widened to 151 Bcf from 138. Futures punished on the print. Waha marks unchanged: latest published still May 22 (-\$4.69 strip, ~\$3.00 cash). <sup>14,16</sup>                                    |
| Uranium (U3O8)           | Futures below \$85                | Eased from the \$86 area late May; no in-window spot print, June marks n/d. <sup>22</sup>                                                                                                                                                               |
| ERCOT large-load queue   | 438 GW; PUCT June 18              | Batch Zero goes to the PUCT Thursday. Permian rig count: Baker Hughes prints today 1:00 PM ET. <sup>19</sup>                                                                                                                                            |

## II. Lead: De-Escalation Repriced the Macro. The Claim Layer Repriced Itself.

Two prints in the window, and they point in opposite directions. The macro one: Trump called off Thursday-night strikes, announced a 60-day ceasefire that reopens the Strait of Hormuz, and crude gave back 4% while the Dow put up its best day of the quarter, +930.<sup>1,4,5</sup> The micro one arrived the same twenty-four hours and got none of the relief: Oracle guided fiscal-2027 capex to as much as \$95B against negative \$23.7B free cash flow and lost 9.4% of its equity on a +1.86% index day, and CoreWeave paid 9.625% for unsecured dollar paper while its own secured facility sits at SOFR+2.25.<sup>7,8,9</sup> The war premium is leaving the barrel. It is not leaving the AI credit stack, because it was never the war holding that premium up.

The rates read is unchanged and now cleaner: the June 17 FOMC is a ~96.5% hold, no 2026 cuts are priced anywhere on the curve, and the probability of a hike within a year was still rising on June 11 even as the long end rallied to ~4.95-5.01%.<sup>2,3</sup> The energy shock that drove two hot headline CPI months is now reversing at the commodity level, which deflates the inflation leg going forward; the 23.5% of trailing energy inflation already in the CPI base does not reverse with it. That asymmetry, stated in Vol 16 §XVI, gets its first live test over the next two CPI cycles. The structural exposure is also unchanged: every SOFR-plus instrument in the AI complex was struck assuming the next move was down, and the market has now removed that assumption without replacing it.

### ANGLE

The ceasefire is the best thing that has happened to the AI credit stack's funding math this quarter, and the stack repriced wider anyway. On the single best risk day since the war began, the marginal cost of unsecured AI infrastructure debt printed 9.625% and the largest cloud backlog ever recorded traded down 9%. When the claim layer cannot rally on a +930 Dow, the discount is not geopolitical. It is the funding gap.

**Falsification (status after the window):** the Vol 16 stated condition was core at or below 2.7% with hike odds below 40%; core printed 2.9%, not triggered, and the hold-with-hawkish-language base case is now ~96.5% priced. New named risk: a signed, executed Hormuz reopening deflates the energy leg faster than the hiking leg matures; if July CPI energy turns negative M/M and 2026 hike odds collapse below 40%, the lead thesis loses its catalyst and reverts to the long-end leg alone.

## III. Oracle Forensics: The Largest Claim Ever Printed Came With a Funding Test

Oracle's Q4 FY26 print (June 10, after the bell) is the claim layer in one filing. Record revenue: \$19.2B in the quarter, +21%; cloud \$9.9B, +47%; infrastructure \$5.8B, +93%. Record backlog: remaining performance obligations of \$638B, up 363% Y/Y and up \$85B sequentially.<sup>7</sup> The funding side of the same filing: Q4 capex \$15.9B, full-year \$55.7B against \$50B guided; fiscal-2027 capex guided up to \$95B; free cash flow negative \$23.7B for the year; return on invested capital down from 14.8% to 10.7%.<sup>8</sup> The market read the second list: ORCL opened down 11.1% and closed down 9.4% on a day the Dow rose 930 points. A shareholder litigation probe into whether management downplayed the capex trajectory opened within twenty-four hours.<sup>8</sup>

The detail that matters for the physical-layer thesis: Oracle disclosed that most of the Q3 and Q4 RPO additions were large-scale AI contracts in which the customer either prepaid Oracle for the GPUs or bought and supplied the GPUs themselves, with those prepaid and customer-supplied hardware portions totaling \$75B.<sup>7</sup>

**ANGLE**

Customers are now paying the cloud vendor in hardware. A \$75B slice of the most celebrated backlog number ever printed is not future compute demand in the ordinary sense; it is counterparties pre-positioning physical GPUs inside someone else's funding structure because neither side trusts the other to finance delivery later. That is the turbine-slot logic arriving inside the hyperscaler P&L: the scarce thing is funded, delivered hardware in an energized shell, and contracts are being written to secure it in kind. Meanwhile the \$638B claim must be served by capex Oracle does not generate internally; at negative \$23.7B FCF, every dollar of that buildout is somebody's new debt in a no-cut rate regime.

**Falsification:** Oracle funds the FY27 program without material net new issuance, or ROIC inflects upward while the backlog converts, either of which would prove the claim layer self-financing at current rates.

**IV. CoreWeave: The Unsecured Print Marks the Stack**

CoreWeave announced and priced a \$3.5B two-tranche senior unsecured offering in the window: \$1.25B at 9.625% and EUR 2B at 8.500%, both due July 15, 2032, guaranteed on a senior unsecured basis by certain wholly-owned subsidiaries, institutional and non-US buyers only, proceeds to general corporate purposes including repayment of outstanding debt, closing expected June 18.<sup>9</sup> The equity closed flat (+0.14% at \$95.74) on the strongest index day of the quarter and sits more than 20% below its June 1 peak.<sup>10</sup>

The print completes the capital-structure picture Vol 16 §IV-V assembled. Secured, ratings-engineered paper at the project level: CRWV DDTL 4.0 at SOFR+2.25 (~5.9% indicative), APLD ComputeCo 3 at 7.000%. The same complex unsecured at the parent: 9.625%. The 370 bps between CoreWeave's own secured and unsecured cost is the market's stated price for everything above the collateral: the corporate claim, the residual, the equity cushion the founders have been selling.

**The cost-of-capital tape, June 12, 2026: secured vs unsecured AI infrastructure debt**

CoreWeave unsecured tranches priced June 11 (due Jul 15, 2032), shown at stated coupons; EUR tranche not FX-adjusted. DDTL and revolver floaters shown at indicative fixed-equivalents from Vol 16; they reprice upward with any hike.

**ANGLE**

The June 11 print is the first clean unsecured mark for the AI infrastructure complex since the hiking repricing began, and it landed 370 bps above the same issuer's secured project paper. The structure-versus-asset spread Vol 16 tracked inside APLD is now printed inside CoreWeave at full size. Note what the proceeds do: repay outstanding indebtedness. The ladder is now refinancing itself at the unsecured layer to keep the secured layer's covenants clean, two days after the founders' cumulative \$2.3B of equity sales were tabulated and fifteen days before index funds become the marginal buyer of the stock.

**Falsification (register status):** founder-buying trigger unchanged, no new Form 4s surfaced in the window. New test added: if the 2032 unsecured paper trades up through 8.5% yield while DSCR season approaches, the market is re-rating the corporate claim, not just the collateral, and the divergence thesis weakens.

**V. Deals, Financings, and Capital Flows: The Window's Term Sheets**

| Date                                 | Transaction                          | Terms                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Jun 11 (priced)                      | CoreWeave \$3.5B senior unsecured    | <b>\$1.25B at 9.625% and EUR 2B at 8.500%, both due July 15, 2032.</b><br>Senior unsecured, guaranteed by certain wholly-owned subsidiaries; institutional and non-US buyers; proceeds to general corporate purposes including repayment of outstanding indebtedness; closing expected June 18. First unsecured benchmark for the complex this cycle. <sup>9</sup>                      |
| Jun 11-12 (priced; trades today)     | SpaceX IPO                           | <b>\$135 fixed price, 555.6M shares, ~\$75B raise at ~\$1.77T valuation.</b><br>Ticker SPCX, Nasdaq. Largest IPO in history. ~30% (~\$22B) reserved for retail. Offshore perpetual futures marked ~\$176 pre-open, +30% vs the print. <sup>11</sup>                                                                                                                                     |
| Jun 10 (after close)                 | Oracle FY27 capex guide              | Up to <b>\$95B</b> fiscal-2027 capital expenditure guided, after FY26 closed at \$55.7B vs \$50B guided. FY26 free cash flow negative \$23.7B. Funding mix beyond operating cash flow n/d at the print; coverage references additional debt issuance. See §III. <sup>7,8</sup>                                                                                                          |
| Jun 8 (filed)                        | OpenAI confidential S-1              | Submitted to the SEC June 8, one week after Anthropic's June 1 confidential filing. Combined SpaceX/OpenAI/Anthropic pipeline estimated near \$4T of market value and more than \$240B of capital absorption by year-end. Definitive OpenAI terms remain n/d pending the public S-1. <sup>12</sup>                                                                                      |
| May 18 (correction; hearings Jun 10) | NextEra / Dominion definitive merger | <b>All-stock, \$66.8B equity value, announced May 18.</b> Corrects Vol 16 §IX, which carried the transaction as exploratory with terms n/d. Largest power-sector combination on record; combined large-load pipeline ~130 GW. Virginia legislators examined the deal June 10; Dominion offered a \$10/month ratepayer rebate for two years. Close guided 12-18 months. <sup>17,18</sup> |

**VI. Crude: The War Premium Exits the Barrel**

*Kept strictly separate from the gas analysis below.* The 60-day ceasefire announced June 11 carries the physical terms that matter: the Strait of Hormuz opens with no tolls, Iran clears its own mines within 30 days, the US lifts the port blockade and issues sanctions waivers restoring Iranian export flow, and the enriched-uranium stockpile is the first negotiation item inside the window.<sup>5</sup> WTI closed \$87.71, fell to \$86.51 in extended trade, and is lower again premarket; the de-escalation has taken roughly \$8 off the barrel in two sessions.<sup>4,13</sup> Physical normalization lags the headline: mines must actually clear, idled fields restart, and damaged facilities repair before flows normalize, and a June reopening was already viewed as unlikely by tanker

analysts.<sup>6</sup> The supply stack behind the reopening is unchanged from Vol 16: OPEC+ adding 188,000 b/d in July, record US exports, Chinese imports at 8-year lows, and the crude-side shale ramp arriving into it. A signed deal converts Fitch's end-July reopening model from forecast to schedule, with Q4 oversupply as the printed risk case.

## VII. Natural Gas: The Surplus Builds While Crude De-Escalates

The June 11 storage report printed a 108 Bcf injection for the week ending June 5 against a 99 Bcf consensus and a 110 Bcf year-ago build, widening the surplus to the five-year average from 138 to 151 Bcf; futures sold the print.<sup>14</sup> The June 9 STEO did the structural work: May Henry Hub averaged \$2.94, EIA expects ~\$3.34 for the second half of 2026, and the 2027 forecast was cut by \$1.13 versus January, to \$3.46, explicitly on the storage overhang.<sup>15</sup> Waha marks are unchanged in the window; the latest published remain May 22 (Summer strip -\$4.69, cash near -\$3.00).<sup>16</sup> The gas-side thesis is unchanged and the week strengthened it: crude-priced rigs keep adding associated gas into a hub already in surplus, and Baker Hughes prints the rig count at 1:00 PM ET today against Enverus's ~240.

## VIII. Power, Utilities, and the Texas Calendar

| Item                 | Status                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PUCT Batch Zero vote | <b>June 18</b> , Thursday. ERCOT's batch framework goes for final approval; the batch forecast is expected mid-August, the reliability-standard report in December, and PUCT market-design decisions in the first half of 2027 per the revised timeline to be presented at the meeting. <sup>19</sup>                                                                 |
| Oncor 765 kV CCN     | Decision still expected <b>this month</b> ; no order in the window. The pending application is Longshore Switch to Drill Hole Switch, ~180 miles, CCN amendment filed December 11, 2025, energization December 2028 if approved. <sup>20</sup>                                                                                                                        |
| NextEra / Dominion   | Definitive (see §V correction). Virginia hearings opened June 10; the ~130 GW combined large-load pipeline is the asset being priced, consistent with the Vol 16 read that this is a bid for load-pocket position. <sup>17,18</sup>                                                                                                                                   |
| Reeves County GCD    | Historical Use Permit deadline <b>September 1</b> : 81 days out. Board meets June 18, same day as the PUCT vote. Unchanged. <sup>23</sup>                                                                                                                                                                                                                             |
| OBBBA cliff          | <b>July 4: 22 days</b> . No stay motion filed in the window. Counsel alerts converge on one read: appellate review outlasts July 4 and reversal could apply retroactively, so qualifying under the physical-work test remains the only safe path even with the 5% safe harbor restored. The Vol 16 procurement-sprint logic stands on both legal paths. <sup>21</sup> |

### ANGLE

June 18 is now a four-event day: the PUCT takes Batch Zero, the Reeves County GCD holds its last scheduled meeting before the water deadline, CoreWeave's unsecured notes close, and the 765 kV order window stays open through month-end. Texas converts queue position and pumping history into property the same week the AI complex's unsecured cost of capital gets marked to market. Both sides of the trade print within five business days.

**Falsification:** unchanged from Vol 16 for Batch Zero and the 765 kV CCN; the Reeves deadline trigger is a GCD extension past September 1.

## IX. Register Sweep: Unchanged Threads

Electrification (Eaton/Vertiv/GEV): no in-window prints; the Q2 reporting season remains the falsification test for backlogs and the 2029-2030 turbine shelf. Nuclear fuel: uranium futures eased below \$85 late May, June spot n/d; no new gigawatt-scale nuclear PPA printed in the window, so the \$68.90-to-\$102/MWh tape stands. APLD: the \$1.59B notes close on or about June 16; the Building 3 assignment condition (subsidiary IG rating) remains the open half of the rating-as-asset test. Midstream/LNG: no new in-window term sheets; the 2041-paper-at-sub-6x thesis is unchallenged this window.

## X. Conclusions, Angled

1. The war premium is leaving crude and was never what held up the AI credit stack's pricing. On the best risk day of the quarter, the claim layer's marginal unsecured cost printed 9.625% and the largest backlog ever recorded lost 9% of its equity value.
2. Oracle disclosed \$75B of its \$638B RPO as prepaid or customer-supplied GPUs. Counterparties are securing physical hardware in kind inside other companies' funding structures. That is the physical-layer thesis written into an issuer disclosure.
3. CoreWeave's 370 bps secured-to-unsecured gap inside one capital structure is the printed price of the claim above the collateral. Vol 16 argued the durable value sits at the project layer; the unsecured market just agreed.
4. The hiking-cycle lead thesis survives the window but acquires a named decay path: a signed Hormuz reopening deflates the energy leg while the hold-with-hawkish-language base case (~96.5%) plays out. The long-end leg, a ~5% 30-year, does not depend on it.
5. Correction discipline: Vol 16 carried NextEra/Dominion as exploratory; it was a definitive \$66.8B all-stock merger signed May 18. The correction strengthens the underlying read: the largest utility combination on record is a purchase of load-pocket position and a ~130 GW interconnection pipeline.
6. June 18 concentrates the Texas rights-formation calendar and the AI complex's funding calendar into one day. Pre-held physical position in Pecos and Reeves still costs the same; the paper claims against it got more expensive this week.

## XI. Footnotes and Sources

1. TheStreet Stock Market Today live blog and Yahoo Finance, June 11, 2026 close: Dow +929.97 (+1.86%) to 50,848.75; Nasdaq +2.5%; S&P 500 +1.7%; tech, industrials, materials led; energy, staples, real estate declined; Trump called off planned strikes and said a deal is close.
2. TradingEconomics US 30Y, June 11: eased to ~5.01%; Yahoo Finance ^TYX June 11 close 4.951, -1.47%.
