

9.65 GW

of hyperscale capacity is going in within 19.3 miles of the property – 7.65 GW of it already under construction.

Two campuses sit on the same north-south line through the tract. The larger is Amazon-owned and building now, on the largest power permit issued anywhere in the United States this year. Both chose this corridor for the same reasons the property offers: land, water, gas and a place on the grid.

CAMPUS

25+ GW

ANNOUNCED ACROSS THIS
COUNTY AND THE NEXT

Caramba North

1,300 contiguous acres · I-10 frontage · no zoning

★ 1 Amazon — 7.65 GW

15.5 mi · under construction · 35 gas turbines

2 Second announced campus

19.3 mi · site work underway · 2 GW planned on-site gas

Counterparty site names withheld pre-NDA. Distances measured from the tract boundary to each site's disclosed location.

Power, water and fuel are already permitted here – not applied for.

The three things that stop most large projects – a place on the grid, water, and fuel to make power on site – are settled on this property.

WATER

47,418 ACRE-FEET PER YEAR

About **42 million gallons a day**, permitted on adjacent affiliated land – roughly **two-thirds of every industrial water right** the local groundwater district has issued. It is permitted for industrial use, at a volume that supports large-scale cooling.

WHY THIS AQUIFER

The Edwards–Trinity aquifer here is refilled each year by runoff from the mountains to the south, rather than drawn from a reservoir that only depletes. Its recharge record held through the 1950s drought of record – the driest stretch in modern Texas history.

WHY IT IS HAPPENING HERE, NOW

Requests to connect large new loads to the Texas grid grew from 63 GW at the end of 2024 to roughly 474 GW by August 2026, about 90% of it data centres – enough that the state paused new reviews pending an audit. The capacity already permitted and building around this property is outside that queue.

NATURAL GAS FOR ON-SITE POWER

20 MILES TO THE WAHA HUB

West Texas gas trades below the national benchmark – at times below zero as new pipelines rebalanced the basin. That is why both neighbouring campuses are building their own gas generation rather than waiting in line for grid power.

Indicative supply quote in hand	200,000 MMBtu/day
Term	15 years, at the hub price
Utility build contribution	\$15–25 million
Build lead time	9–15 months

GRID, FIBER AND ACCESS

15 MILES TO THE 765 kV IMPORT TERMINUS

The property sits fifteen miles from where all three approved 765 kV import lines land – the largest transmission program in the grid operator’s history, already approved and being built. Three substations sit within seven miles, and Fort Stockton – town services and a regional airport – is about five miles east.

Long-haul fiber	Along the I-10 corridor
Rail	Union Pacific Sunset Route
Zoning	None – industrial as of right
